DATA ENTRY AND OFFICE ASSISTANT

Data Entry Portfolio

Customer records. Excel data quality. Inventory reporting.

Three practical projects showing how structured records are entered, checked, corrected, and prepared for review.

01 CUSTOMER RECORDS

Customer entry and record maintenance

A browser-based customer workspace for entering, updating, finding, and handing off structured customer records.

02 EXCEL DATA CLEANUP

Standardization and exception handling

An Excel workbook that keeps original customer data alongside cleaned records, source-issue flags, and a concise quality summary.

03 INVENTORY REPORTING

Structured inventory records and SQL reporting

A PostgreSQL inventory project with a Python and Streamlit interface for product records, stock movements, purchasing, and reporting.

Start with the Excel sample
Review 42 customer records, documented corrections, and 10 unresolved follow-up items. Then try the customer-records demo and inspect the SQL reporting examples.

Supporting files
The companion project folders include the workbook, source files, case studies, and review instructions. Extract the portfolio ZIP before opening the browser demo.

PROJECT 01

Customer Records

Customer entry and record maintenance

A browser-based customer workspace for entering, updating, finding, and handing off structured customer records.

Task
Keep customer details and order statuses consistent while reducing duplicate entry.

Workflow
Enter or import customer records, review validation messages, search and filter the list, correct records, and export a CSV handoff.

Quality controls
Required name and email fields, email-format validation, case-insensitive duplicate prevention, and spreadsheet-safe CSV export.

Review the work
Open Projects/01 Customer Records/index.html. Add a fictional customer, try the same email twice, filter by status, then export the results.

Scope
Browser-local demonstration with fictional sample data. Accounts and payments are simulated. No production usage or typing-speed claim is made.

PROJECT 02

Excel Data Cleanup

Standardization and exception handling

An Excel workbook that keeps original customer data alongside cleaned records, source-issue flags, and a concise quality summary.

Task
Prepare inconsistent customer records for review while keeping uncertain information visible.

Workflow
Preserve raw data, trim spacing, standardize name case, normalize email and recognizable U.S. phone formats, then log corrections and unresolved issues.

Verified sample
42 records: 32 marked READY and 10 marked FOLLOW UP. Four rows have duplicate-email flags, two invalid-email flags, and two missing-required-field flags. Issue categories may overlap.

Review the work
Open the workbook in Projects/02 Excel Data Cleanup. Compare Row ID 1001 across Raw Data, Cleaned Data, and Quality Checks, then read Data Summary.

Judgment
Missing or uncertain values stay unresolved. Similar company names are not merged without confirmation. Formatting corrections remain documented even when a row is ready.

42	32	10
Sample records	Ready for handoff	Follow-up items

PROJECT 03

Inventory Reporting

Structured inventory records and SQL reporting

A PostgreSQL inventory project with a Python and Streamlit interface for product records, stock movements, purchasing, and reporting.

Task

Organize inventory information and preserve a traceable stock-movement history.

Workflow

Maintain product records, record stock operations, track purchase orders, and review inventory and replenishment reports.

Technical evidence

Seven core relational tables, an ERD and data dictionary, 12 reporting queries, and controlled database functions for stock operations.

Review the work

Start with docs/erd.png and docs/data_dictionary.md in Projects/03 Inventory Reporting. Read sql/05_reporting_queries.sql. The README contains database and dashboard setup steps.

Verification scope

Current local test run: 6 passed and 6 database integration tests skipped because no test database was configured. Native PostgreSQL concurrency and connected dashboard screenshots remain unverified.
